

Dargues mine has one High Volume Air Sampler (HVAS). The unit is designed to sample Particulate matter less than 10µm (PM10). The monitoring samples are sent to Australian Laboratory Services monthly for analysis.

During the 2019/20 summer there were reported exceedances which were likely the result of the drought, bushfires and associated dust storms. The longterm criterion for exceedence @ PM10 is 30µg/m3.
